Apéndice 1. Parámetros de trazado. Listados
1. Trazado en planta
2. Trazado en alzado

1. Introducción y objeto

El presente Anejo tiene por objeto la definición de las características del trazado propuesto de las alternativas consideradas en el presente Estudio Informativo de la línea de alta velocidad entre Sevilla y Huelva, así como las características de cada uno de los elementos constitutivos de la superestructura de vía.

2. Consideraciones generales

El abanico de radios y pendientes empleados en las distintas soluciones es consecuencia del análisis del trazado, tratando de minimizar el movimiento de tierras y las afecciones al medio ambiente y a los planeamientos urbanos.

De acuerdo con los parámetros geométricos de trazado establecidos como criterios de diseño, se han planteado los trazados de las diferentes alternativas cuyo recorrido se describe en apartados posteriores.

En relación al trazado en planta se marca como objetivo prioritario la mayor longitud de tramos en recta o bien, en su defecto, radios de curvas muy amplios, que permitan velocidades de circulación que como norma general permitan circular a velocidades de 350 km/h, y sección tipo para vía doble.

En cuanto al trazado en alzado se plantea un diseño con pendientes máximas de 15 milésimas.

Para la definición geométrica de las soluciones en planta y alzado de las nuevas alternativas, se han aplicado las Norma IGP-3 (2011). Los parámetros de diseño adoptado son:

Parámetros Funcionales de diseño del trazado

| Velocidad máxima de proyecto: | | V _{máx} (km/h) < 140 | | 140 < V _{máx} (km/h) < 200 | | 200 < v _{máx} (km/h) < 250 | | 250 < v _{máx} (km/h) < 300 | | 300 < v _{máx} (km/h) <350 | | | |

3. Descripción general de las alternativas

Como punto de partida y antecedente técnico se cuenta con el Estudio Informativo del proyecto “Línea de alta Velocidad Sevilla-Huelva” redactado en 2002, en el cual se consideraron seis (6) alternativas de trazado, emitiéndose Declaración de Impacto Ambiental sobre la alternativa seleccionada denominada “Norte La Palma”. Posteriormente, se redactan cinco (5) proyectos constructivos de plataforma que desarrollan la alternativa seleccionada y aprobada del Estudio Informativo inicial, siendo éstos los siguientes:

- Tramo 1 Majarabique – Valencina de la Concepción
- Tramo 2 Valencina de la Concepción – Sanlúcar la Mayor
- Tramo 3 Sanlúcar la Mayor – La Palma del Condado
- Tramo 4 La Palma del Condado – Niebla
- Tramo 5 Niebla - Huelva

En esta fase de redacción se parte de la alternativa desarrollada en dicho Estudio Informativo, así como de los proyectos de construcción redactados, integrando la modificación del enlace ferroviario de Majarabique, tramitado durante la redacción del proyecto del tramo Majarabique-Valencina de la Concepción. A esta alternativa inicial se plantean variantes de trazado tomando en consideración los resultados de la información pública sobre el Estudio de Impacto Ambiental del Estudio Informativo original, así como las recomendaciones reflejados en el informe del Ministerio de Agricultura y Pesca, Alimentación y Medio Ambiente (MAPAMA).

A esta escala 1:5.000 se plantean las siguientes alternativas de trazado:

- Alternativa 1-1 y 1-2
- Alternativa 2-1 y 2-2
- Alternativa 3-1 y 3-2

Las alternativas 1 y 3, desarrollan sus ejes conjuntamente durante los primeros cincuenta kilómetros, dirección Este – Oeste, y al norte de las poblaciones Albaida de Aljarafe, Paterna del Campo y Villalba de Alcor. Este desarrollo está basado en la alternativa seleccionada en el EI anterior denominada “Norte La Palma”. Estas alternativas, se bifurcan una vez sobrepasada la población de Villalba de Alcor, manteniéndose para las soluciones 1, el eje de la nueva LAV sensiblemente

paralelo al corredor del FC actual. Para las soluciones 3, el trazado se situará al norte de la línea del FC evitando así el paso por las poblaciones de Niebla y San Juan del Puerto, para seguidamente buscar la aproximación a Huelva, y entroncar con el eje de la Nueva Estación de Alta Velocidad de Huelva.

Para las soluciones 1, y a su paso por San Juan del Puerto, se han desestimado las soluciones de soterramiento debido a que la cota de inundación del Río Tinto en esa zona para Q100 y Q500, se encuentra a la cota +3, y +3.4, con lo que una cota de soterramiento que estaría en torno a la -8, sería inviable. También se han desestimado las soluciones de grandes viaductos sobre las marismas del Río Tinto debido a la complejidad constructiva y al enorme impacto visual que producirían al entorno.

La diferencia entre las soluciones seguidas de -1 y -2 está en el paso por La Palma del Condado, siendo las -1 las que pasan al sur de esta población, y las -2 las que se sitúan al Norte de la misma.

Las soluciones 2 mantienen su eje común con las alternativas 1 y 3 hasta el PK 10+000 aproximadamente en el entorno de la población de Valencina de la Concepción, punto a partir del cual, giran ligeramente al Sur para aproximarse más a las poblaciones de Olivares, Salteras y Villalba de Alcor. Siendo esta zona de orografía más desfavorable que la atravesada por las alternativas 1 y 3, será necesario recurrir a estructuras de consideración en su recorrido.

A partir del entorno de la última población mencionada, la alternativa 2-2 girará al Norte, coincidiendo su eje, a partir de este tramo, con la alternativa 3-2. De igual forma sucederá con la alternativa 2-1 que buscará el corredor de la alternativa 3.1 y coincidirán a partir del entronque en planta y alzado.

Cabe destacar que, aunque la nueva línea de Alta Velocidad se diseña para tráfico de viajeros, los parámetros en alzado adoptados con pendientes máximas de 15 milésimas, permitirían perfectamente el tráfico de mercancías

Se realiza a continuación una descripción de todas las alternativas de trazado planteadas en esta fase del estudio, así como exponer los parámetros adoptados para su definición geométrica tanto en planta como en alzado.

- **Nudo ferroviario de Majarabique**

Todas las alternativas planteadas tienen su origen en la zona en donde está ubicado el actual triángulo ferroviario de Majarabique, al norte de la ciudad de Sevilla y a unos 6,3 kilómetros desde la estación de Santa Justa, siguiendo el recorrido de las vías del AVE en sentido Sevilla-Madrid.

Para enlazar con dicha línea, se plantea la necesidad de realizar un nudo de conexión compuesto por ramales de vía única que permiten los 4 sentidos de circulación posibles: Madrid-Huelva, Sevilla-Huelva, Huelva-Madrid y Huelva-Sevilla. Como se comenta anteriormente, la modificación de dicho enlace se tramitó durante la redacción del proyecto constructivo del tramo inicial Majarabique-Valencina de la Concepción, si bien en la presente fase de redacción del Estudio Informativo, y con el fin de optimizar el trazado y los correspondientes movimientos de tierras han sido rediseñados.

Dicho enlace ferroviario está formado por cuatro ramales, que se enumeran a continuación:

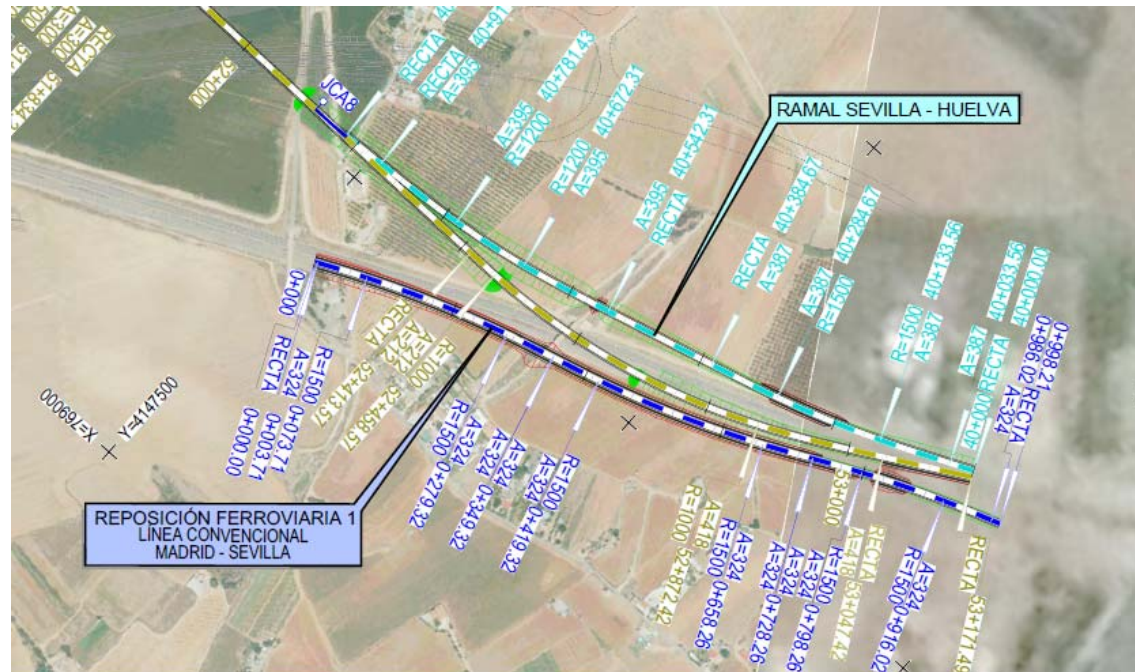

- Ramal Huelva-Madrid
- Ramal Madrid-Huelva
- Ramal Sevilla-Huelva
- Ramal bidireccional Huelva-Sevilla

Los ramales de conexión Madrid - Huelva y Huelva - Madrid conectarán con la L.A.V. Madrid – Sevilla a la altura de la Estación de Mercancías de Majarabique, antes del cambiador de anchos de Majarabique. Una vez superada la zona del nudo ferroviario, estos ramales se juntarán formando una vía doble. En el caso del ramal Madrid-Huelva, el trazado diseñado utiliza parcialmente el de la actual conexión Madrid-Huelva de la línea convencional, por lo que una vez puesto éste en servicio se considera la supresión de la conexión actual.

El ramal de conexión Sevilla-Huelva conecta con el ramal bidireccional Huelva-Sevilla, ambos en vía única, antes de llegar al nudo ferroviario de Majarabique, para proseguir el trazado con vía única dado la frecuencia de tráfico ferroviario esperado, siendo el ramal bidireccional Huelva-Sevilla el que conecta con los ramales Madrid-Huelva y Huelva-Madrid en las proximidades de la actual instalación ferroviaria de carga y descarga de Majarabique. Una vez superada dicha instalación ferroviaria son los ramales Madrid-Huelva y Huelva-Madrid los que conforman el tronco de la LAV Sevilla-Huelva en vía doble.

Debido a la conexión del Ramal bidireccional Huelva Sevilla con la LAV Madrid Sevilla, ha sido necesario desplazar la línea de ancho convencional Madrid – Sevilla, paralela a la anterior en una longitud aproximada de 998 m, mediante la “Reposición Ferroviaria 1. Línea convencional Madrid-Sevilla”.

En cuanto al trazado en alzado se ha considerado excepcionalmente una pendiente máxima de 25 milésimas en la rasante de los ramales debido a la necesidad de pasar con gálibo sobre infraestructuras existentes y planificadas, reduciendo al máximo el número y longitud de estructuras, con el fin de optimizar en su totalidad la funcionalidad del nudo ferroviario. Una vez abandonado el nudo de Majarabique, y cuando los ramales Madrid-Huelva y Huelva-Madrid se unen en una única plataforma, la rasante se dispone a cotas similares a la vía actual Sevilla-Huelva.

| Designación | PKi | PKf | Longitud (m) |
|------------------------------------|--------|-----------|--------------|
| Ramal Madrid-Huelva | 20+000 | 21+399,15 | 1.399,15 |
| Ramal Huelva-Madrid | 30+000 | 32+431,56 | 2.431,56 |
| Ramal Sevilla-Huelva | 40+000 | 40+972,27 | 972,27 |
| Ramal bidireccional Huelva-Sevilla | 50+000 | 53+171,49 | 3.171,49 |

- **Alternativa 1**
- **Alternativa 1-1**

Esta alternativa, con una longitud total aproximada de 94,3 km, tiene su origen una vez superado el nudo ferroviario de Majarabique en la provincia de Sevilla hasta el cruce con la Autovía H-30 en la provincia de Huelva, donde se produce la conexión con el “Proyecto modificado de la infraestructura ferroviaria en la nueva Estación de Huelva”.

En su tramo inicial la Alternativa 1-1 discurre paralela a la línea ferroviaria actual Sevilla-Huelva mediante una sucesión de tramos rectos y curvas circulares a izquierda y derecha con un abanico de radios empleados comprendido entre 1.300 y 5.000 metros hasta aproximadamente el P.K. 8+500 en el que el trazado se separa del corredor de la vía actual mediante una curva a izquierda de radio 5.000 metros con una posterior curva-contracurva (derecha-izquierda) de radio 12.500 metros enlazadas con clotoides de 200 metros de longitud para posteriormente continuar con una curva de orientación suroeste de radio 7.250 y desarrollo de aproximadamente 5.430 metros con longitud de clotoide de 460 metros que da paso a una alineación recta entre los P.K. 19+282 y 21+852 con la misma orientación suroeste de 2.570 metros de longitud en la que ubicar el P.A.E.T. de Olivares (PK 19+650 a PK 21+850).

Tras el P.A.E.T. propuesto el trazado toma orientación oeste con una curva a derecha de radio 10.400 metros y longitud de clotoides de 260 metros salvando el

cruce con la carretera A-477, para dar paso a dos alineaciones rectas de 1.538 y 2.311 metros de longitud unidas mediante una alineación curva de radio 11.000 metros. Con este trazado la LAV discurre entre la urbanización “Los Ranchos de Guadimar” y la instalación de generación de energía eléctrica propiedad de Abengoa, manteniendo en todo momento un amplio resguardo horizontal respecto de ambos condicionantes geográficos.

El trazado mantiene alineación recta, tras una curva de radio 7.250 metros, entre los P.K. 31+930 y 41+182, con una longitud de 9.252 metros con la que la Alternativa 1-1 se adentra en la provincia de Huelva y mediante curva-contracurva (izquierda-derecha) de radios 7.250 y 7.600 metros, respectivamente, enlazadas con una alineación recta de aproximadamente 2.340 metros de longitud, conecta con el corredor de la vía actual a la altura de la localidad de La Palma del Condado, aproximadamente, en el P.K. 53+500. El trazado propuesto atraviesa dicha población, en la que está prevista la ubicación, dentro del núcleo urbano de la misma, de la única estación a lo largo del recorrido Sevilla-Huelva entre el PK 54+860 y el PK 55+860.

A partir de este punto el trazado discurre atravesando las poblaciones de Villarrasa, Niebla y San Juan del Puerto, manteniéndose la nueva LAV sensiblemente paralela al actual corredor ferroviario Sevilla-Huelva, con una geometría apta para alta velocidad, siendo la zona donde por motivos geométricos más se separan los dos corredores, al sur de la población de Niebla entre los P.K. 66+000 y 71+500. Al final de esta zona y previo al cruce bajo la A-49 (Autovía del V Centenario), los dos ejes ferroviarios, el actual y el proyectado, volverán a tener el mismo encaminamiento.

Posteriormente al cruce bajo la A-49, el trazado de la nueva LAV se mantiene paralelo al actual, hasta el final del trayecto en la entrada a la estación de Huelva en el P.K. 94+353, disponiendo una rasante con cotas similares, reduciendo de este modo el movimiento de tierras asociado, así como el impacto al entorno. Está previsto la ubicación de un P.A.E.T. dentro del término municipal de San Juan del Puerto, estando éste situado fuera del casco urbano de dicha población entre el los PK 76+800 y 78+400, garantizando en todo momento la permeabilidad en el entorno urbano mediante la ubicación de pasos a distinto nivel, en el caso de

viales que deban ser repuestos, y de pasarelas peatonales que salvarán tanto el FC actual, como la nueva LAV propuesta.

Como se ha comentado anteriormente, y con el objetivo de mantener una geometría apta para alta velocidad a lo largo de la totalidad del itinerario, es inevitable la afección al ferrocarril existente, motivo por el cual se proponen reposiciones ferroviarias de la vía convencional que darán solución a estas afecciones, siendo éstas las siguientes:

| Designación | Longitud (m) |
|--------------------------|--------------|
| Reposición Ferroviaria 2 | 3.366 |
| Reposición Ferroviaria 3 | 3.196 |
| Reposición Ferroviaria 4 | 3.133 |

• **Alternativa 1-2**

Sobre la alternativa anterior se plantea una modificación del trazado antes de entrar en la población de La Palma del Condado, con el objetivo de evitar algunas alineaciones curvas al atravesar dicha población con radios en planta que no siguen los parámetros geométricos de una LAV. Esta modificación se lleva a cabo desplazando el trazado al norte de La Palma del Condado a partir del P.K. 47+700 mediante la inclusión de una curva-contracurva (derecha-izquierda) de radio 7.250 metros, volviendo a conectar con el trazado propuesto de la Alternativa 1-1 hasta

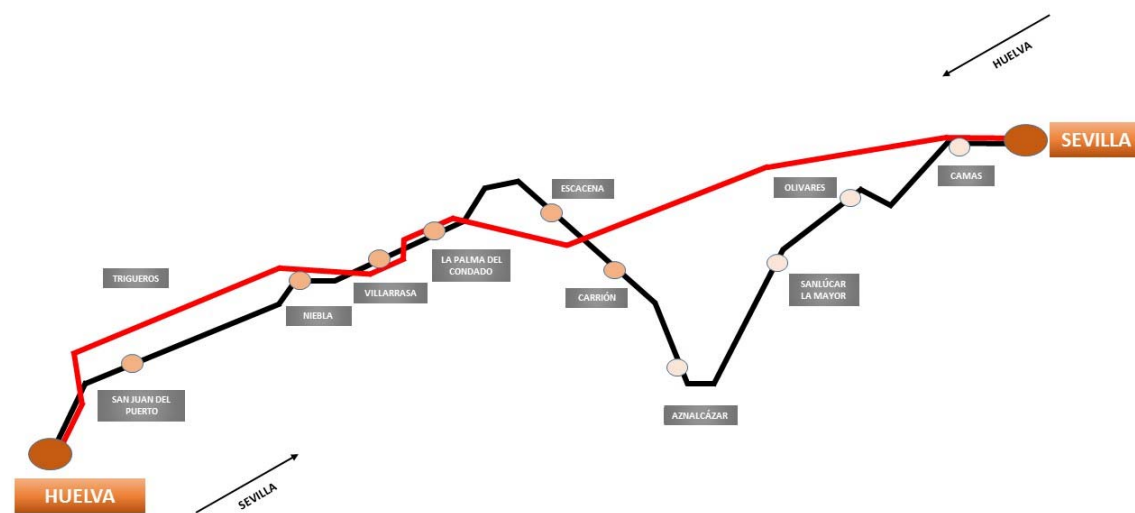

el final del trayecto, en el P.K. en 59+650, en las proximidades de la siguiente población Villarrasa, mediante una curva a derecha de radio 5.350 metros.

La longitud total aproximada de la Alternativa 1-2 es de 94,2 km, compartiendo trazado una vez superada la población de Villarrasa, tal y como se ha comentado anteriormente, con la Alternativa 1-1, siendo por tanto aplicable todo lo expuesto para aquella alternativa.

De igual manera que con la alternativa 1-1, se prevé las siguientes reposiciones ferroviarias:

| Designación | Longitud (m) |
|--------------------------|--------------|
| Reposición Ferroviaria 3 | 3.196 |
| Reposición Ferroviaria 4 | 3.133 |

- **Alternativa 2**
- **Alternativa 2-1**

Esta alternativa, con una longitud total de aproximadamente 95,4 km, tiene el origen común con la Alternativa 1, con la que comparte trazado en los ocho primeros kilómetros tanto en planta como alzado, a partir del cual su desarrollo se separa del de la alternativa seleccionada en el Estudio Informativo redactado en 2002, y toma una orientación suroeste hasta aproximadamente el P.K. 30+000,

mediante una sucesión de curvas de radio 7.250 metros con longitud de clotoides de 460 m e intercaladas con alineaciones rectas que permiten en conjunto velocidades de 350 km/h, si bien la orografía más desfavorable en este tramo hará preciso la ejecución de un túnel de 1.850 metros de longitud entre los P.K. 15+160 y 17+010, denominado túnel de La Muela, por ser el nombre del cerro que atraviesa, así como la ejecución de falsos túneles a lo largo del trazado en las zonas de desmontes con trincheras de altura superiores a 10 metros dada la presencia de margas azules y los malos condicionantes geotécnicos de este material.

Una vez sobrepasado el río Guadimar mediante un viaducto de 1.198 metros de longitud, se propone la ubicación de un P.A.E.T. en el término municipal de Sanlúcar La Mayor entre los P.K. 24+400 y 26+600, aprovechando una zona de terreno más favorable que permite la implantación de una pendiente longitudinal de 2 milésimas.

A partir del P.K. 30+000, el trazado discurre paralelo a la carretera A-472 mediante curva-contracurva (izquierda-derecha) de radio 7.250 metros con longitud de clotoides de 460 metros para, posteriormente, dar paso a una recta de 4.767 metros de longitud hasta las proximidades de Villalba del Alcor, con una orografía más favorable y pendiente ascendente del terreno aplicando una rampa ascendente en el trazado de 15 milésimas hasta el punto alto del terreno, aproximadamente, en el P.K. 45+300 en donde el terreno inicia un descenso, aplicando de nuevo 15 milésimas de pendiente descendente hasta aproximadamente el P.K. 48+000, coincidente con la curva a izquierda de radio 7.250 metros mediante la cual el trazado de la alternativa discurre paralelo al corredor ferroviario actual, conectando con el trazado de la Alternativa 1-1 a la altura de la localidad de La Palma del Condado, aproximadamente, en el P.K. 52+500. De igual modo al descrito para la alternativa 1-1, el trazado propuesto para la alternativa 2-1 atraviesa dicha población, en la que está prevista la ubicación, dentro del núcleo urbano de la misma, de la única estación a lo largo del recorrido Sevilla-Huelva entre el PK 54+878 y PK 54+868.

A partir de este punto el trazado discurre atravesando las poblaciones de La Palma del Condado y Villarrasa, y, una vez sobrepasada esta última población, vuelve a

separarse del corredor ferroviario actual, para evitar la afección al ámbito de la Gravera de Balastera, situada ésta al suroeste de la población de Niebla.

Esta variante de trazado al norte de Niebla, se realiza mediante una curva-contracurva (derecha-izquierda) de radios 7.250 metros con longitud de clotoides de 460 metros, con la que se cruza sobre el cauce del Río Tinto mediante un viaducto de 560 metros de longitud situado entre los PK 64+653 y 65+213, a la que, posteriormente, se incluye una amplia alineación curva de radio 10.000 metros de orientación suroeste con una longitud de 5.545 metros, con la que la Alternativa 2-1 discurre paralela al norte de la A-49 (Autovía del V Centenario) a lo largo de gran parte del desarrollo de dicha curva y de la alineación recta posterior de 7.081 metros de longitud, en la que está previsto la ubicación de un P.A.E.T. en el término municipal de Trigueros entre los P.K. 76+068 y 78+268.

Con esta segunda parte de la variante de trazado propuesta desde el P.K. 80+000 se evita el paso por el casco urbano de San Juan del Puerto, realizándose de este modo al norte de dicha población y manteniendo paralelismo con la autovía A-49. El cruce sobre la carretera N-435 se produce en el desarrollo de la alineación recta anterior, que da paso a una amplia curva a izquierda de radio 7.250 metros intercalada con otra recta de orientación sur-oeste con lo que la LAV discurre al norte del Centro Penitenciario de Huelva. A lo largo del desarrollo de la curva posterior de radio 2.200 se producen los cruces sobre la autovía A-49, la carretera N-431, la autovía H-31 y la línea ferroviaria en dirección a Zafra, y una vez superadas estas infraestructuras el trazado toma orientación sur mediante una curva a derecha de radio 1.125 metros hasta conectar en el P.K. 90+940 con el corredor de la línea ferroviaria actual y, por tanto, con la Alternativa 1-1, con la que comparte trazado hasta el final del trayecto.

Como se ha comentado anteriormente, y con el objetivo de mantener una geometría apta para la nueva línea alta velocidad a lo largo de la totalidad del itinerario, se producen afecciones y posteriores reposiciones ferroviarias de la línea convencional actual, siendo éstas las siguientes:

| Designación | Longitud (m) |
|-------------|--------------|
|-------------|--------------|

| | |
|--------------------------|-------|
| Reposición Ferroviaria 2 | 3.366 |
| Reposición Ferroviaria 4 | 3.133 |

• **Alternativa 2-2**

Esta alternativa con una longitud de 95,7 km comparte el mismo trazado que la Alternativa 2-1 hasta el P.K. 44+451, situado al norte de la población de Manzanilla, en la que, con el fin de evitar el paso por La Palma del Condado, toma una orientación este mediante una curva-contracurva (izquierda-derecha) de radios 7.250 metros con la que se conecta con el trazado propuesto de la Alternativa 1-2 con el objetivo de evitar algunas alineaciones curvas al atravesar dicha población con radios en planta que no siguen los parámetros geométricos de una LAV, hasta sobrepasada la población de Villarrasa en el PK 59+029, en donde vuelve a separarse del corredor ferroviario actual y mantiene el mismo trazado hasta el final del trayecto que el propuesto para la alternativa 2-1, siendo por tanto aplicable todo lo expuesto para aquella alternativa.

De igual manera que con la alternativa 2-1, se prevé la siguiente reposición ferroviarias:

| Designación | Longitud (m) |
|--------------------------|--------------|
| Reposición Ferroviaria 4 | 3.133 |

- Alternativa 3
- Alternativa 3-1

Esta alternativa tiene una longitud total de 96,4 km, compartiendo trazado con el corredor de la Alternativa 1-1 hasta sobrepasar la población de La Palma del Condado, por lo que lo descrito anteriormente para la Alternativa 1-1 es de aplicación a esta Alternativa 3-1.

La Alternativa 3-1 se separa del trazado común aproximadamente en el P.K. 61+500 con el objeto de evitar la afección al ámbito de la Gravera de Balastera, situada al suroeste de la población de Niebla, así como en lo referente a evitar el paso por el casco urbano de San Juan del Puerto. A partir de dicho punto kilométrico esta Alternativa 3-1 comparte trazado hasta el final del trayecto con la Alternativa 2-1, siendo por tanto aplicable todo lo expuesto para aquella alternativa.

Las reposiciones ferroviarias previstas y su longitud a lo largo de la alternativa 3-1 son las que se enumeran a continuación:

| Designación | Longitud (m) |
|--------------------------|--------------|
| Reposición Ferroviaria 2 | 3.366 |
| Reposición Ferroviaria 4 | 3.133 |

- Alternativa 3-2

Esta alternativa, con una longitud aproximada de 96,3 km, comparte trazado con la Alternativa 1-2 hasta el P.K. 61+426, una vez sobrepasada La Palma del Condado por el norte de dicha población, por lo que lo descrito para la Alternativa 1-2 es de aplicación a esta alternativa.

La segunda parte del trazado de esta alternativa hasta el final del trayecto es el mismo que el definido para la Alternativa 2-2.

La reposición ferroviaria prevista para mantener el tráfico de la vía actual y su longitud afectada en esta alternativa 3-2 es la que se expone a continuación:

| Designación | Longitud (m) |
|--------------------------|--------------|
| Reposición Ferroviaria 4 | 3.133 |

- **Conexión de Alternativas 1 y 3 con la línea actual**

Para el caso de las alternativas 1.1, 1.2, 3.1 y 3.2, se ha estimado la posibilidad de que pueda haber una conexión ferroviaria con la vía actual por funcionalidad ferroviaria.

Se aprovecha la proximidad de los corredores de estas alternativas a la vía actual en el entorno de Villalba de Alcor para realizar esa conexión, de cerca de mil quinientos metros de longitud, que tiene su origen en el P.K. 47+532 de estas.

El trazado de casi mil quinientos metros de longitud, queda definido por una curva (antihoraria) y contracurva (horaria) de 1.100 m y 1.500 m de radio respectivamente.

Se incluyen a continuación unas tablas en las que se muestran los parámetros geométricos utilizados en las seis alternativas descritas, tanto en planta como en alzado, así como sus longitudes.

Para el trazado en planta se establecen unos rangos de radios de las alineaciones circulares asociados a un correspondiente rango de velocidades máximas admisibles:

| Velocidad máxima de circulación V (km/h) | Radio R (m) |
|---|--------------------|
| V < 140 | R < 1.000 |
| 140 ≤ V < 200 | 1.000 ≤ R < 2.200 |
| 200 ≤ V < 250 | 2.200 ≤ R < 3.550 |
| 250 ≤ V < 300 | 3.550 ≤ R < 5.350 |
| 300 ≤ v < 350 | 5.350 ≤ R < 7.250 |
| V ≥ 350 | R ≥ 7.250 y Rectas |

Para el trazado en alzado, se establecen en este caso unos rangos en función de la pendiente dispuesta:

| Pendiente dispuesta P(‰) |
|-----------------------------|
| 0 ≤ P < 4 |
| 4 ≤ P < 8 |
| 8 ≤ P < 12 |
| 12 ≤ P < 15 |
| P = 15 |

Se incluyen en el Apéndice 1 los listados de planta y alzado de cada una de las alternativas consideradas.

TRAMIFICACIÓN DE LAS ALTERNATIVAS EN PLANTA

| ALTERNATIVA | LONGITUDES | | | | | | | | |
|-----------------|--------------------|-----------------------|-----------|---------------|-----------------------|-----------------------|-----------------------|-----------------------|---------------|
| | Longitud Total (m) | Longitud Acuerdos (m) | Recta (m) | R < 1.000 (m) | 1.000 ≤ R < 2.200 (m) | 2.200 ≤ R < 3.550 (m) | 3.550 ≤ R < 5.350 (m) | 5.350 ≤ R < 7.250 (m) | R ≥ 7.250 (m) |
| ALTERNATIVA 1-1 | 94.353 | 19.591 | 40.810 | 1.545 | 3.264 | 1.518 | 5.827 | 2.447 | 19.351 |
| ALTERNATIVA 1-2 | 94.257 | 19.431 | 37.068 | 1.545 | 2.790 | 499 | 5.269 | 3.665 | 23.990 |
| ALTERNATIVA 2-1 | 95.466 | 20.529 | 34.381 | 571 | 3.538 | 5.028 | 1.202 | 4.795 | 25.424 |

| ALTERNATIVA 2-1 | 95.466 | 25.970 | 23.035 | 13.303 | 7.649 | 4.697 | 20.812 |
| ALTERNATIVA 2-2 | 95.730 | 24.889 | 26.093 | 11.828 | 7.124 | 6.321 | 19.474 |
| ALTERNATIVA 3-1 | 96.449 | 30.801 | 26.585 | 17.712 | 4.370 | 5.621 | 11.359 |
| ALTERNATIVA 3-2 | 96.353 | 29.549 | 30.511 | 15.268 | 4.351 | 7.231 | 9.443 |

4. Superestructura de vía

Se considera superestructura ferroviaria a los elementos empleados para transmitir las cargas de los trenes a la plataforma base, incluida la capa de forma.

Para el presente Estudio Informativo se ha considerado la ejecución de una superestructura que posea las características necesarias para permitir la circulación por ella de trenes de alta velocidad.

Se ha previsto la ejecución de plataforma para vía doble y ancho estándar en todas las alternativas consideradas, plataforma para vía única de ancho estándar en los ramales que conforman el nudo ferroviario de Majarabique, y plataforma

para vía única de ancho convencional en las reposiciones ferroviarias de la línea actual en los tramos en que se contempla la ejecución de variantes.

4.1. Tipología de vía

Según los tramos de las que se trate, se ha decidido utilizar los siguientes tipos de superestructura:

- Vía sobre balasto para los tramos en superficie
- Vía en placa, en los túneles cuya longitud sea igual o mayor de 1.500 m.

Para la adopción del tipo de vía se han considerado los aspectos económicos, las limitaciones geométricas existentes, la posible transmisión de ruido y vibraciones a edificaciones próximas y la facilidad de acceso para mantenimiento o situaciones de emergencia.

4.2. Vía sobre balasto

Se conoce como balasto la grava o piedra machacada que, formando una capa, se extiende sobre la explanación de una vía férrea para asentar sobre ella y sujetar las traviesas que soportan los carriles. Su objetivo es, además, proporcionar una base drenante lo suficientemente estable como para mantener la alineación de la vía con un mínimo de mantenimiento. Constituye una parte débil de la estructura de la vía férrea y tiene, en concreto, las siguientes funciones:

- Amortiguar las acciones que ejercen los vehículos sobre la vía al transmitir las a la plataforma.
- Repartir uniformemente estas acciones sobre dicha plataforma.
- Evitar el desplazamiento de la vía, estabilizándola en dirección vertical, longitudinal y transversal.
- Facilitar la evacuación de las aguas de lluvia.
- Proteger los suelos de la plataforma contra la acción de las heladas.
- Permitir la recuperación de la geometría de la vía mediante operaciones de alineación y nivelación.

Cuando la vía discurre en superficie la solución más adecuada, por ser la más económica y no existir condicionantes de gálibo ni ser importante la transmisión

de vibraciones que se ven suficientemente amortiguadas por una plataforma de tierra que no es rígida, es la vía sobre balasto.

La vía sobre balasto resulta, en general, menos ruidosa que las vías en placa y si fuere necesario, se pueden disponer en las secciones en que se aplica pantallas antirruído convencionales.

Para este tipo de vía, el carril debe ser pesado (60 kg/ml) para una buena repartición de esfuerzos, menores tolerancias de recepción (0,3 mm con regla de 1,5 m) y amolado previo a la puesta en explotación para eliminar las ondas largas (0,25 a 2,50 m) resultantes de la laminación del carril.

Por lo tanto, es necesario mantener un mínimo de 30 cm de balasto de buena calidad, que garantice una buena resistencia al desgaste bajo una traviesa pesada que proporcione un buen anclaje.

De acuerdo con lo expuesto, la vía estará formada por carril 60 kg y traviesas de hormigón pretensadas o postensadas con sujeción elástica tipo Vossloh.

Sobre estructuras, como puentes o marcos, se suprime la capa de subbalasto y se amplía la capa de balasto a un espesor de 40 cm. El paso de la plataforma de tierra a la estructura se realizará con las correspondientes cuñas de transición que eviten los puntos donde se produzca un cambio brusco de rigidez.

4.3. Vía en placa

La vía sin balasto surge en la búsqueda de un modelo de superestructura de vía que requiera poco mantenimiento, garantizando la estabilidad de la marcha del vehículo; y a la hora de planificar nuevas líneas, en las que el porcentaje de túneles y puentes respecto a la longitud total se incrementa notablemente.

La vía en placa es un sistema formado por una serie de elementos clásicos de la vía sobre balasto (carril, fijaciones y traviesas) junto a otros que le confieren su carácter específico: una placa de hormigón (a veces otro ligante), que puede presentar distintas características y que puede estar formada por distintas capas con o sin la presencia de elastómeros o capas bituminosas intermedias.

El posible deterioro del balasto puesto de manifiesto en algunas líneas de velocidad alta y tráfico mixto, o de alta velocidad en curso de explotación, es otro

factor que impulsa el desgaste de la vía sin balasto como superestructura de vía a considerar en el futuro.

Las cada vez más exigentes prescripciones medioambientales pueden encontrar en la vía sin balasto una solución para una mejor inserción de la obra lineal en el territorio que atraviesa por su posibilidad de admitir peraltes elevados.

Por el contrario, es necesaria una profundización en los aspectos de absorción de emisiones sonoras reflejadas por las losas y de las vibraciones producidas al paso de circulaciones.

Por lo tanto, en el túnel proyectado, denominado túnel de La Muela, se ha propuesto el empleo de la vía en placa, por requerir menor espesor que la vía sobre balasto, con el consiguiente ahorro en la excavación y en el desvío de servicios, y por tener menores exigencias de mantenimiento.

Debido al carácter concatenado del falso túnel existente previo al túnel de La Muela, se considera a efectos de seguridad un solo túnel de 2.130m, empezando por el emboquille de entrada del falso túnel y acabando en el emboquille de salida del túnel de La Muela. Esto implica que deberá existir vía en placa en toda la longitud considerada a efectos de seguridad.

4.4. Características de la vía

A continuación, se describen los elementos que componen cada una de las dos tipologías de vía anteriormente comentadas.

4.4.1. Vía sobre balasto

4.4.1.1. Capa de forma

Como criterio general, en el caso de obra nueva, se deberá disponer siempre de una plataforma con capacidad portante alta, clase P3, con objeto de minimizar los espesores necesarios de balasto y subbalasto y de mejorar el comportamiento a largo plazo, según lo especificado en la Orden FOM/1631/2015 por la que se aprueba la Instrucción para el proyecto y construcción de obras ferroviarias IF-3, en la normativa vigente de ADIF NAV 2-1-0.0 y NAV 2-1-0.1 y teniendo en cuenta también lo establecido en la norma UIC 719/94.

La plataforma que sirve de asentamiento de la superestructura debe quedar rematada por una capa de terminación, llamada capa de forma, provista de pendientes transversales para la evacuación de aguas pluviales.

La capa de forma de la plataforma es la capa superior de remate y coronación de la explanada o superficie del terraplén o excavación. Su función principal es mejorar la capacidad portante de ésta. Ha de ser compactable y de mejores características que las de la explanada.

En el caso de fondo de desmontes, si el material es de calidad QS0 se ha de proceder a realizar un cajeadado de 1 m de profundidad y un relleno posterior con material que posea, al menos, las características de los suelos QS2.

Si en el fondo del desmonte se cuenta con un material de calidad QS1, QS2 ó QS3 no se considera necesario realizar este cajeadado y posterior relleno.

Teniendo en cuenta las conclusiones del estudio geotécnico realizado en esta fase, en las zonas con margas azules, el fondo del desmonte debe de ser saneado con 1m de espesor y en la base de este saneo, se debe colocar un geotextil impermeabilizante. El espesor de la capa de forma sobre el terreno saneado es de 60 cm sobre el que se colocan 30 cm de la capa de subbalasto. Por su parte, en los tramos en relleno se dispondrá, con carácter general, un espesor de 60 cm de capa de forma sobre la capa superior de coronación.

Las características que debe presentar esta capa se resumen a continuación:

- Coeficiente de desgaste de los Ángeles menor del 30%
- Límites de Atterberg: LL<30 y IP<10
- Ensayo CBR superior a 20.

4.4.1.2. Subbalasto

La capa sub-balasto debe existir en todos los casos de plataforma, incluso en los pedraplenes donde se emplea como capa de igualación y como elemento de reparto de las cargas.

Debe estar formada por una grava arenosa bien graduada, con algún porcentaje de elementos finos para que sea compactable, no se desligue bajo el tráfico de

las máquinas durante la obra, sea insensible al hielo y proteja la plataforma de la erosión de las aguas de lluvia.

Los elementos que la integran deben ser suficientemente duros para resistir las cargas transmitidas por el balasto, siendo recomendable en este sentido:

- Debe poseer un porcentaje no menor del 30% de material proveniente de machaqueo.
- Deval seco > 12.
- Deval húmedo > 6.
- Coeficiente Los Angeles < 28.

La capa de sub-balasto debe quedar compactada al 105 por 100 de la densidad del ensayo Proctor normal.

Según las recomendaciones antes comentadas se ha considerado un espesor de 30 cm de espesor de subbalasto con una pendiente transversal del 5%. En el paso sobre estructuras no se hace necesario la inclusión de subbalasto en la superestructura.

4.4.1.3. Balasto

La banqueta de balasto tiene como finalidad: repartir las cargas verticales sobre la plataforma y absorber los esfuerzos horizontales impidiendo el desplazamiento de la vía, tanto longitudinal como transversalmente. Para cumplir estos fines, el balasto que la constituye debe estar bien consolidado, además de poseer unas características adecuadas, y la propia banqueta debe estar dotada de dimensiones suficientemente amplias, pero no excesivas, dado el coste del balasto y el sobrepeso que supone aumentar la plataforma para alojarla.

El balasto será de naturaleza silíceo, y preferentemente de origen ígneo o metamórfico, y de tipo 1, según la norma NRV 3-4-0.0., disponiéndose en una capa de 35 cm de espesor bajo traviesas. En el caso de vía sobre estructuras el espesor mínimo de balasto es de 40 cm bajo traviesas.

Para este uso concreto, se requieren rocas resistentes al desgaste por abrasión y al ataque químico, para poder resistir el desgaste y la degradación resultado del efecto de martilleo producido por el tráfico ferroviario.

Además, debe presentar las siguientes condiciones:

- La carga de rotura debe ser superior a 1200 kg/cm².
- La granulometría debe estar comprendida entre 31,5 mm y 50 mm en su mayor parte, con una curva granulométrica bien graduada para conseguir un mayor número de contactos entre partículas.
- El coeficiente de desgaste de Los Ángeles no será mayor del 14%.
- El índice de forma será menor de 11.
- La pendiente de la banqueta será de 3H:2V con un ancho de hombro lateral de 1,10 m.

4.4.1.4. Carril

Las funciones que debe desempeñar los carriles dentro del conjunto de la vía se esquematizan a continuación:

- Absorber, resistir y transmitir a las traviesas los esfuerzos recibidos del material motor y móvil al igual que los de origen térmico.
- Servir de guía al material circulante con la máxima continuidad.
- Servir de elemento conductor para el retorno de la corriente en líneas explotadas con tracción eléctrica.
- Servir de conductor para las corrientes de señalización.

Carril 60 E1

El carril a utilizar tanto en la línea de alta velocidad como en los tramos de línea convencional será de tipo 60 E1 de calidad 260 (antiguo UIC-60 de calidad 900 A).

Sus características son las siguientes, referidas a la Norma Europea CEN/TC256/WG4 "Flat Bottom symmetrical railway rails 46 kg/m and above" (Carriles simétricos de base plana de 46 kg/m y superiores) de Marzo de 1998:

- Perfil del carril:clase X
- Enderezado:clase A
- Grado del acero:260 (Carbono-Manganeso)
- Resistencia a tracción: $R_m \geq 880 \text{ N/mm}^2$
- Dureza: 260/300 HBW
- Alargamiento: $A \geq 10\%$

Otras características geométricas fundamentales que deben cumplir estrictamente las barras elementales procedentes de la acería tienen relación con las tolerancias del acabado del perfil, la rectitud en los extremos, la planitud superficial y la torsión.

En la siguiente figura se incluye el perfil de este carril:

4.4.1.5. Traviesas

Las principales funciones de las traviesas consisten en:

- Conseguir mantener la estabilidad de la vía mediante la adecuada absorción y transmisión de esfuerzos.
- Asegurar el ancho de la vía sin alteraciones temporales.
- Facilitar el asiento del carril con su correspondiente inclinación.
- Evitar la conducción eléctrica respecto del retorno de la corriente de tracción (dificultar la aparición de corrientes vagabundas)

Traviesa tipo AI-VE

La traviesa a instalar en las vías generales de la Línea de Alta Velocidad, es del tipo AI-VE, para ancho estándar y carril 60 E1.

Esta traviesa es monobloque de hormigón pretensado con armaduras pretesas o postesas, con 4 casquillos o vainas de anclaje modelo AV-1 para sujeción VE, que se colocan en los moldes antes del hormigonado de la traviesa en cualquiera de las modalidades de fabricación para que queden embutidos en la misma.

La resistencia característica del hormigón a compresión simple a 28 días será superior a 60 N/mm^2 para cualquiera de los métodos de fabricación.

Entre dos ejes de traviesas contiguas la separación es de 0,6 metros.

Las características geométricas más relevantes de la traviesa tipo AI son las siguientes:

- Longitud: 2,6 metros.
- Peso aproximado ~ 320 Kg.
- Anchura máxima en la base: 300 mm.
- Altura en la sección bajo eje de carril ~ 242 mm.
- Altura en la sección central ~ 210 mm.
- Inclinación del plano de apoyo del carril: 1/20.

Sujeción VE

Por unidad de traviesa, los componentes del sistema de sujeción, son los siguientes:

- 4 espigas o vainas AV-1 para sujeción VE de poliamida 6.6 reforzada con un 35% de fibra de vidrio para la fabricación del cuerpo de la vaina y poliamida

6 reforzada con un 50% de fibra de vidrio para la fabricación de la pieza denominada antigiro. (Plano de Mantenimiento de Infraestructuras de ADIF; P16.8001.00).

- 2 placas de asiento, PAE-2, bajo carril de 7mm de espesor de material termoplástico. (Plano de Mantenimiento de Infraestructuras de ADIF; P16.5076.00)
- 4 clips elásticos SKL-1 de acero. (Plano de Mantenimiento de Infraestructuras de ADIF; P16.0089.00)
- 4 tirafondos AV-1 para sujeción VE con arandela, de acero. (Plano de Mantenimiento de Infraestructuras de ADIF; P16.8002.00)
- 4 placas acodadas ligeras A2 de poliamida 6.6 reforzada con un 35% de fibra de vidrio. (Plano de Mantenimiento de Infraestructuras de ADIF; P16.4961.00)

Traviesa tipo PR con sujeción VE

Se utilizarán traviesas PR con sujeción VE en los tramos de vía convencional y carril 60 E1.

Estas traviesas son monobloque de hormigón pretensado con armaduras pretesas o postesas, con 8 casquillos o vainas de anclaje para la traviesa PR-VE, que se colocan en los moldes antes del hormigonado de la traviesa en cualquiera de las modalidades de fabricación para que queden embutidos en la misma.

La resistencia característica del hormigón a compresión simple a 28 días será superior a 50 N/mm² para cualquiera de los métodos de fabricación.

Entre dos ejes de traviesas contiguas la separación es de 0,6 metros.

Las características geométricas más relevantes de la traviesa tipo PR son las siguientes: Longitud: 2,6 metros.

- Peso aproximado ~ 292 kg. (Variable en función del fabricante)
- Anchura máxima en la base: 300 mm.
- Altura en la sección bajo eje de carril para ancho 1.668 mm ~ 234 mm. (variable en función del fabricante).

- Altura en la sección bajo eje de carril para ancho 1.435 mm ~ 228 mm. (Variable en función del fabricante).
- Altura en la sección central ~ 200 mm. (Variable en función del fabricante).
- Inclinación del plano de apoyo del carril: 1/20.

| COTAS* | | UIC 54 | UIC 60 |
|--------|------------|--------|--------|
| A | Ancho 1668 | 2047,5 | |
| C | | 1753 | 1756,3 |
| B | Ancho 1435 | 1814,5 | |
| D | | 1520 | 1523,3 |

Sujeción de traviesa VE

Por unidad de traviesa, los componentes del sistema de sujeción, son los siguientes:

- 8 espigas o vainas AV-1 para sujeción VE de poliamida 6.6 con 30% de fibra de vidrio. (Plano de Mantenimiento de Infraestructuras de ADIF; P16.8001.00)
- 4 tornillos T2 para sujeción VE con arandela, de acero. (Plano de Mantenimiento de Infraestructuras de ADIF; P16.5072.00)
- 2 suplementos soporte de carril (Plano de Mantenimiento de Infraestructuras de ADIF; P16.4562.00)
- 4 clips elásticos SKL-1 de acero. (Plano de Mantenimiento de Infraestructuras de ADIF; P16.0089.00)

Para el Carril 60 E1 se tiene:

- 2 placas de asiento bajo carril de 7 mm de espesor para carril 60 E1 de material termoplástico. (Plano de Mantenimiento de Infraestructuras de ADIF; P16.5076.00)
- 4 placas acodadas ligeras A2 de poliamida 6.6 reforzada con un 35% de fibra de vidrio.
 - 2 Interiores para carril 60 E1 (Plano de Mantenimiento de Infraestructuras de ADIF; P16.4964.00)
 - 2 Exteriores para carril 60 E1 (Plano de Mantenimiento de Infraestructuras de ADIF; P16.4965.00).

4.4.1.6. Montaje de la vía

El montaje de la vía de la línea de alta velocidad se realizará en las fases siguientes:

- 1) Extendido de una capa de balasto por medio de motoniveladora o extendedora, compactada con una pasada de un rodillo compactador. El espesor de la capa será de 15-18 cm.
- 2) Montaje de una vía auxiliar de 2.800 m de longitud, empleando carril usado y traviesas de madera o de segundo uso.
- 3) Transporte con tren carrilero de las barras largas (BLS) de 270 m, que se descargan uno a un lado de la vía auxiliar y tres al otro.
- 4) A continuación, se colocan los carriles de la primera vía (vía directora) con la distancia entre ellos adecuada para la circulación del pórtico de trabajo.
- 5) Por dicha vía directora y por medio del pórtico se transportan y colocan las traviesas, se acanala el balasto y se levanta y transporta, por tramos, la vía auxiliar.
- 6) Sobre el tramo de traviesas se colocan las barras largas soldadas con una máquina posicionadora, apretando a continuación los tirafondos con una motoclavadora.
- 7) Terminado el montaje de la vía directora se procede al montaje de la vía paralela. Para ello se sitúan las barras largas, previamente descargadas, a una distancia entre sí igual a la anchura del pórtico, ripándolas desde su posición de descarga junto a la vía auxiliar.
- 8) Con el tren travesero circulando por la vía directora se descargan traviesas situándolas cada 60 cm.
- 9) A continuación, se procede a la colocación de las barras largas sobre las traviesas con la máquina posicionadora, apretando los tirafondos con la máquina motoclavadora.
- 10) Terminado el montaje de las dos vías se descarga balasto transportado por medio de un tren de tolvas. Posteriormente, se procede a perfilar la banqueta de balasto.
- 11) Se procede seguidamente a alinear la vía y a batearla para conseguir la cota en una primera nivelación.
- 12) La operación siguiente corresponde a la soldadura aluminotérmica y a la liberación de tensiones, pasando a continuación la estabilizadora dinámica para producir una primera compactación.
- 13) Se descarga más balasto, perfilándolo de nuevo para realizar una segunda nivelación y una nueva estabilización dinámica.
- 14) Como última fase se procede a la comprobación geométrica de la vía y al amolado de los carriles.

4.4.2. Vía en placa

La vía en placa es un sistema formado por una serie de elementos clásicos de la vía sobre balasto (carril, fijaciones y traviesas) junto a otros que le confieren su carácter específico: una placa de hormigón (a veces otro ligante), que puede presentar distintas características y que puede estar formada por distintas capas con o sin la presencia de elastómeros o capas bituminosas intermedias.

El sistema de vía en placa propuesto estará formado por dos elementos claramente diferenciados:

- Losa de hormigón en masa (prelosa).
- Losa de vía en el que irán embebidas las traviesas.

El hormigón de la prelosa será HM-20.

La losa de vía en placa, irá armada con fibras y será la encargada de soportar directamente las cargas de ferrocarril, y transmitir estas a las capas inferiores en condiciones admisibles.

La clase de resistencia del hormigón se ha definido, según la norma española EHE, como un HA-30/F/20/IIa con fibras de polipropileno con una dosificación de 900 g/m^3 y con cemento resistente al sulfato.

- Anchura: 2.80 m.
- Espesor 24.0 cm.
- Hormigón HA-30 con fibras de polipropileno

Tanto en la boca de entrada como en la de salida de los túneles, se ha considerado un tramo de 20 m con vía en placa armada para evitar que fisure debido a los incrementos de temperatura. La armadura longitudinal propuesta es $18 \Phi 20$ y la armadura transversal es $1\Phi 20 / 0,65$.

El sistema de vía en placa considerado es con traviesa bibloque o similar.

La sujeción se suministra entera y premontada en la traviesa.

El sistema de sujeción tiene un importante papel en el sistema puesto que es el responsable de aportar elasticidad a la vía.

Las placas guía angulares permiten mantener el ancho de vía. Por último, el mecanismo de sujeción se aprieta con unos tirafondos que se introducen en los huecos que la traviesa tiene practicados al efecto.

4.4.2.1. Montaje de vía en placa

Las principales actividades para el montaje en vía única los siguientes:

- Reparto y colocación de traviesas desde camión.
- Descarga de carril auxiliar en barras de 18m desde camión.
- Encuadre de traviesa, colocación de carril auxiliar, clavado y embridado.
- Colocación de usillos alineación y nivelación de vía en un tramo de 108 m.
- Vertido de hormigón mediante bomba.
- Desclavado y retirada de carriles auxiliares.
- Descarga, clavado y embridado de carril en barra larga desde tren carrilero mediante pórticos y rodillos.
- Soldadura y liberación de tensiones.

De modo esquemático se representa el procedimiento de montaje de vía a continuación. Tras finalizar las tareas reflejadas, se procede a realizar los mismos trabajos para la otra vía a montar:

MONTAJE DE VÍA DOBLE EN PLACA

1.- REPARTO DE TRAVIESAS DESDE CAMIÓN

2.- COLOCACIÓN TRAVIESAS SOBRE LA TRAZA EN VÍA 1

3.- DESCARGA DE CARRIL AUXILIAR DE 18m (60-E1) MEDIANTE PÓRTICO DESDE CAMIÓN EN VÍA 1

4.- ENCUADRE DE TRAVIESA, COLOCACIÓN DE CARRIL, CLAVADO DE VÍA Y EMBRIDADO DE VÍA 1

MONTAJE DE VÍA DOBLE EN PLACA

5.- COLOCACIÓN DE USILLOS, ALINEACIÓN Y NIVELACIÓN DE VÍA

6.- HORMIGONADO DE VÍA DESDE CAMIÓN HORMIGONERA DE VÍA 1

7.- DESCLAVADO Y TRASLADO DE CARRIL AUXILIAR 18m (60-E1) EN VÍA 1

8.- MONTAJE DE BARRA LARGA CON PÓRTICO Y CLAVADO DE CARRIL EN VÍA 1

4.4.3. Aparatos de vía

Los desvíos y escapes a emplear son los indicados en los ramales de vía única que componen el nudo ferroviario de Majarabique y en el ramal de vía única de Conexión ferroviaria con la vía actual.

A continuación, se incluye una tabla con las coordenadas de los aparatos proyectados:

| SEVILLA - HUELVA | | | | | | | | |

4.4.4. Otros elementos de la superestructura

4.4.4.1. Piquetes de vía libre

Los piquetes de vía son, unos bloques de hormigón, de dimensiones 60 cm de longitud, 35 cm de anchura y 25 cm de altura, sobresaliendo de la superficie de balasto 15 cm y llevando la cara superior inclinación a dos aguas.

Están dispuestos en la vía de tal forma que eviten los alcances entre vehículos ferroviarios en las zonas de desvío, sobre todo en playas de vías y estaciones. Estos piquetes estarán colocados justo antes de la zona en la cual se influyen las trayectorias de dos trenes que confluyen al desvío (zona de alcance). El objeto de estos piquetes es indicar al maquinista no sobrepasar el punto en el cual está ubicado el piquete, ya que, en caso de confluencia de 2 vehículos ferroviarios, el alcance es inminente.

Se adjunta a continuación el esquema de cómo posicionar los piquetes.

Esquema de ubicación de piquetes de vía libre

4.4.4.2. Postes Hectométricos, Kilométricos y de Cambio de Rasante

Se dispondrán los correspondientes postes de kilometraje de la vía, los hectométricos y los de cambio de rasante.

Los postes serán de chapa situados sobre los postes de electrificación lo suficientemente visibles para los maquinistas.

En los postes hectométricos y kilométricos se indicará con número entero el valor del P.K., situándose bajo el mismo el valor de la centena del punto hectométrico correspondiente; por ejemplo, el P.K. 40+300 se marcará en el poste como 40,3.

- Están situados a lo largo de la línea e indican la situación kilométrica y hectométrica.
- Llevan en la cara opuesta la misma inscripción.

- El número de arriba indica el kilómetro, el de abajo el hectómetro y la flecha, la dirección en que se encuentra la estación más próxima, para el caso de petición de socorro o de cualquier comunicación.

En las chapas de cambio de rasante se marcará con flecha serigrafiada en color negro el sentido de la inclinación (rampa o pendiente), indicándose sobre la misma, con cifra entera y un decimal el valor de la inclinación (en milésimas). En tramos de pendiente horizontal se imprimirá sobre la chapa una franja horizontal

- Está situado en los puntos que cambia el perfil de la vía e indican la rasante en milímetros por metro y su longitud en metros.
- Llevan en la cara opuesta la inscripción correspondiente al perfil en el sentido contrario de la circulación.

APÉNDICE 1. PARÁMETROS DE TRAZADO. LISTADOS

A continuación, se incluyen los listados del programa de trazado correspondientes al diseño en planta y alzado de las distintas alternativas propuestas. En ellos se recoge la siguiente información:

LISTADOS DE PLANTA.

La definición geométrica del trazado en planta queda reflejada en los listados que se recogen en el apéndice nº1.

El significado de cada una de las columnas que en ellos aparecen es el siguiente:

| | |
|---------------|--|
| DATO : | Corresponde al número de orden de la alineación o elemento de que se trata |
| TIPO : | Describe el tipo de alineación, bien sea recta (RECTA), circunferencia (CIRC.) o curva de transición tipo clotoide (CLOT.) |
| LONGITUD : | Es la longitud en metros de dicha alineación. |
| P.K. : | Indica el orden secuencial del punto kilométrico contado a partir de la estación inicial. |
| X TANGENCIA : | Coordenada X del punto de tangencia del elemento. |
| Y TANGENCIA : | Coordenada Y del punto de tangencia del elemento. |
| RADIO : | Es el valor correspondiente al radio de curvatura en metros de las alineaciones circulares (las rectas tienen $R=0$) |
| PARAMETRO : | Indica el valor del parámetro de la clotoide de transición entre alineaciones sucesivas. |
| AZIMUT : | Es el valor del ángulo que forma la alineación con el norte geográfico, expresado en grados centesimales. |
| Cos/Xc/Xinf : | Valor del coseno del ángulo formado por las alineaciones sucesivas en el punto de tangencia. |

Sen/Yc/Yinf: Valor del seno del ángulo formado por las alineaciones sucesivas en el punto de tangencia.

El signo de radio de curvatura es positivo cuando la alineación gira a la derecha según el sentido de la kilometración y negativo en caso contrario.

LISTADOS DE ALZADO.

La definición geométrica del perfil longitudinal del trazado queda reflejada en los listados que se recogen en el apéndice nº1.

En ellos se recoge la relación de puntos singulares en los cuales se producen variaciones de alineación en la rasante, refiriéndose la cota a la cabeza del carril bajo.

El significado de cada una de las columnas que en ellos aparecen es el siguiente:

los siguientes parámetros:

| | |
|-------------------|--|
| PENDIENTE : | Indica la pendiente en ‰ de la alineación. |
| LONGITUD : | Es el valor en metros de la longitud del elemento. |
| PARAMETRO (Kv): | Representa el valor del parámetro correspondiente a la curva parabólica que define el acuerdo entre alineaciones consecutivas.. |
| VERTICE : | Se define la localización de los vértices de la rasante mediante su punto kilométrico (P.K.) y su cota correspondiente. |
| ENTRADA ACUERDO : | Se define la localización del punto de tangencia a la entrada del acuerdo vertical mediante su punto kilométrico (P.K.) y su cota correspondiente. |
| SALIDA ACUERDO : | Se define la localización del punto de tangencia a la salida del acuerdo vertical mediante su punto kilométrico (P.K.) y su cota correspondiente. |
